III. Operation Instructions

1. Operation Panel

- 1.1 Operation instructions for control panel
- 1. Display that shows the actual consumption power in watt
- 2. Indicate lighting areas in automatic night mode
- 3. Button to start the automatic night mode
- 4. Button to select pump settings
- 5. Automatically run and display light area
- 6. Indicate set function in the pump

Figure 6

Figure 7 Name plate

2 Display description

- 2.1 After power on, displayer in location 1 works.
- 2.2 The exact pump consumption is shown on the display during operation
- 2.3 Failure that disables normal running of the pump (such as stagnation) will be displayed as E(X is 1o2)
- 2.4 If failure displays, it has to cut off the power supply to trouble shot. After trouble shooting, power on and start the pump.

3 Lighting area that shows pump settings.

The circulating pump has eight (ten) settings, which can be achieved through buttons. Pump setting is indicated by eight(ten) different lighting areas

Pressing times	Lighting area	Description	Displayer icon
0	A (Factory setting)	Autoadaptation	A
1	PP1	Min. proportional pressure curve	PP +
2	PP2	Medium proportional pressure curve	PP +
3	PP3	Max. proportional pressure curve	PP +
4	CP1	Min. Constant pressure curve	CP +
5	CP2	Medium Constant pressure curve	CP +
6	CP3	Max. Constant pressure curve	CP +
7	I	Constant speed curve, speed I	s +
8	п	Constant speed curve, speed II	s +
9	Ш	Constant speed curve, speed III	s +
10	А	Autoadaptation	A

For 8-12m Ten Lighting Areas (Art. P.066 and P.076)

4. Lighting area that indicates automatic night mode

If indicated by ()) when it is on, it means it has enabled automatic night mode .

5. Button for enabling automatic night mode

- The button ()) located in 3 will start /stop automatic night mode.
- Automatic night mode is only applicable to the heating system with the said function. (Refer to Section 8 of Chapter 4)
- When automatic night mode is started, the lighting area located in 3 is on.

If APMpump is set to be speed I mode, speed II mode or speed III mode, it cannot choose automatic night mode.

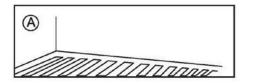

6. Button for selecting pump settings

Press button once, and it only changes one type of pump setting. Pressing eight or ten time is a cycle

7. Pump setting

7.1 Pump setting as per system type

Pump setting as per system type

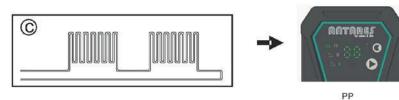

mounted in parallel mode

mounted in single pipe series

Factory setting = autoadaptation mode

The recommended and available pump settings should be referred to the previous Figure.

Location	Custom time	Pump setting		
	System type	Optimum setting	Other available settings	
А	Floor heating system	AUTO	CP	
В	Double pipeline heating system	AUTO	PP2	
С	Single pipeline heating system	PP1	PP2	

AUTO (Autoadaptation mode) is installed in the heating system and double pipeline system under the floor. "AUTO autoadaption" mode adjusts pump performance automatically according to the actual heat demand of the system. Due to the fact that the performance is adjusted gradually, it is suggested to enable the pump to be in "AUTO autoadaption" mode at least one week before changing the pump settings.

If it chooses to change back to "AUTO autoadaption" mode, APMpump can memorize the set point of "AUTO autoadaption" mode last time and continues to adjust performance automatically. The pump setting changes from the optimum setting to other available setting. The heating system is "slow" system and cannot reach optimum running mode in several minutes or several hours. If the ideal heat distribution is not optimally defined, change the setting mode to another available.

7.2 Control of pump

During operation, exert control over the pump as per, Proportioinal pressure control "(PP)" or Constant pressure control "(CP)".

Under the above mentioned two control modes, the pump performance and corresponding consumption power shall be adjusted according to the heat loss of the system.

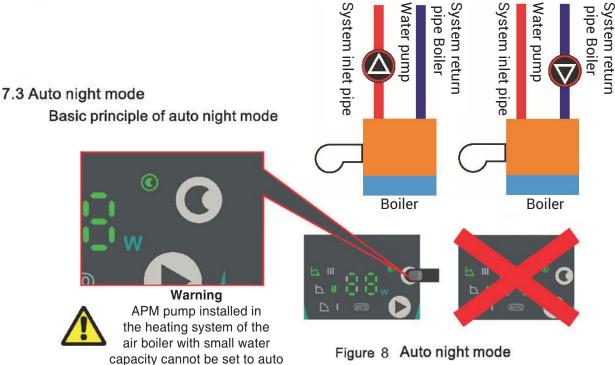

Proportional pressure control

Under this control mode, the pressure difference at both ends of the pump is controled by the flow. In Q/H diagram of proportional pressure curve, indicate with PP1andPP2.

Constant pressure control

Under this control mode, the pressure difference at both ends of the pump keeps stable and is irrelevant to the flow.

Constant pressure curve is indicated by CP1 and CP2. In Q/H, it is a horizontal performance curve.

Note If speed I, speed II, or speed III are selected, auto night mode doesn't function.

If power supply is once cut off, it needs to restart the auto night mode.

If the heating system is providing "Insufficient heat" (lack of heat), it needs to check whether auto night mode has been enabled. If so, disable auto night mode.

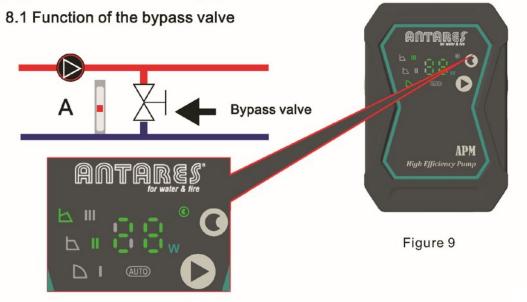

To ensure optimum status of auto night mode, the following conditions must be met:

- The pump must be installed in the inlet pipeline of the system and be close to the outlet of the boiler.
- If the pump is installed in the return water pipeline of the system, auto night mode doesn't function.
- The system (boiler) must have auto control over liquid temperautre.
 Press D button to start the auto night mode.
 The indicator D is on, which means that auto night mode has been enabled.

Auto night mode

- Once Auto night mode is enabled, APM pump can be switched between the Auto mode and Auto night mode.
- Switching between the Auto mode and Auto night mode by the APM pump is depending on temperature in inlet pipeline (non-return water pipeline) of the system.
- If the temperature drop in the inlet pipeline of the system is over 10-15°C within about two hours, APM pump will automatically switch to Auto night mode. Such temperature drop must at least reach 0.1°C/minute. When the flowing pipeline temperaure of the system rises by about 10°C, it will switch to the Auto mode (irrelevant to time)

8. pipeline and return water pipline

35

Figure 10 - System installed with bypass valve

- 8.2 Bypass valve
- 8.2.1 Function of bypass valve: When all valves in the floor heating circuit and /or the temperature control valve of the radiator are closed, the bypass valve can ensure distribution of heat from the boiler.
- 8.2.2 Components in the system.

Bypass-valve

A Flowmeter, located in A

When all valves are closed, it needs to guarantee the minimum flow. Pump setting depends on the type of bypass valve equipped, namely manually -operated bypass valve or temperature-controlled bypass valve.(Figure 10)

8.3 Manually-operated bypass valve

Do as follows:

8.3.1 When adjusting the bypass valve, ensure that the pump is in setting I speed I mode. (Figure 9)

It has to keep the minimum flow (Qmin.) of the system always. Refer to the instructions of the bypass manufacturer.

- 8.3.2 When the bypass valve is adjusted, set the pump as per Chapter 7 of Pump Settings.
- 8.4 Auto bypass valve (temperature-controlled bypass valve)

Do as follows:

8.4.1 When adjusting the bypass valve, the pumpt should be setting I(speed I mode)

It has to keep the minimum flow (Qmin.) of the system always. Refer to the instructions of the bypass manufacturer.

8.4.2 When the bypass valve is adjusted, set the pump to the min.or max.constant presure mode.

9. Start

- 9.1 Before starting
 - 9.1.1 Before starting the pump, it must be sure that the system is filled with liquid and air is drained out. The pump inlet must reach the min.inlet pressure requried.
- 9.2 Exhaust the pump

APM Pump boasts self-exhausting function. Before starting, exhausting is not required. The air in pump might cause noise, which will disappear after running for several minutes.

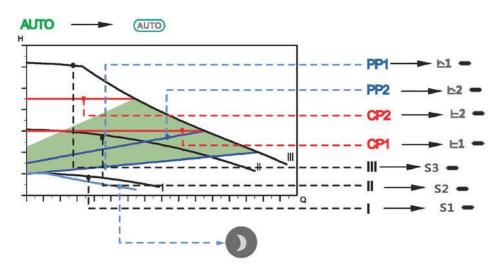

according to the system scale and structure, set the APM pump to be in speed III mode in short period so as to drain the air in the pump quickly. After that, the said noise disappears and set the pump as per the recommended instructions.

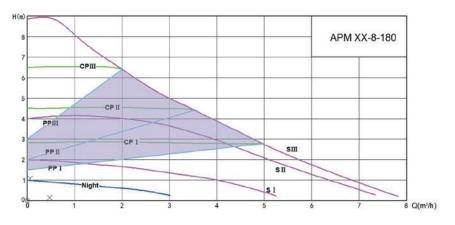

The pump cannot go idling without pumping liquid. Do not start the pump for sytem exhausting.

10. Relation between pump setting and performance

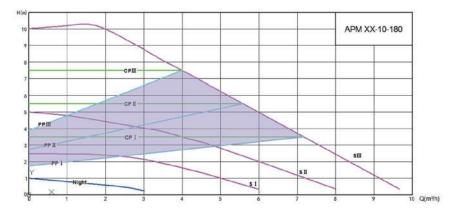

Relation between pump setting and performance is indicated with curve.

(APMXX -10- XX)

IV. Technical Data and Installation Dimensions

1. Technical Data

Supply voltage	230V, -10 %/+ 6 %, 50Hz, PE		
Motor protection	APM circulating pump doesn't need external motor protection		
Protection grade	IP 42		
Isulation grade	F		
Relative ambient humidity	Max. 95%		
System pressure bearing	Max. 1.0 MPa, 10 bar, 102m water column		
	Liquid temperature Min. Inlet pressure		
Quetien inlet pressure	≤+75 °C 0.05 bar, 0.005 MPa, 0.5m water column		
Suction inlet pressure	+90°C 0.28 bar, 0.028 MPa, 2.8m water column		
	+110°C 1.08 bar, 0.108 MPa, 10.8m water column		
EMC Standard	GB4343.2 GB/T17626.4 IEC61000-4-4		
Sound pressure level	The sound pressure level of the pump is less than 43 Decibel		
Ambient temperature	0°C to +40 ℃		
Temperature grade	TF110		
Surface temperature	Max. Temperature is below +125°C		
temperature	+2℃ to +110 ℃		
Declared EEI	≤0.20 (4-6m)		
Declared EEI	≤0.23 (8-12m)		

To prevent condensate water in the control box and the stator, the temperature of the pumping liquid in the pump must be higher than the ambient temperature.

Ambient temperature[°C]	Liquid temperature			
Ambient temperature[°C]	Min. [°C]	Max.[°C]		
0	2	110		
10	10	110		
20	20	110		
30	30	110		
35	35	90		
40	40	70
